**Listing of the Claims:**

Claims 1-63 (Cancelled)

64. (New) A lockset drilling guide comprising:  
a frame defining an opening in said frame, said frame comprising a first flange and a second flange mounted perpendicularly thereto; and  
a non-threaded positioning member removably mountable on said first flange, said positioning member moving from a first position to a second position with respect to said frame;  
wherein said positioning member laterally displaces said opening when said positioning member is moved from said first position to said second position.
65. (New) The lockset drilling guide of claim 64 wherein said non-threaded positioning member is movable independent of movement by said second flange.
66. (New) The lockset drilling guide of claim 64, wherein said opening is formed on said second flange.
67. (New) The lockset drilling guide of claim 64, wherein at said first position said positioning member is attached to said first flange.
68. (New) The lockset drilling guide of claim 67, wherein at said second position said positioning member is unattached to said first flange.
69. (New) The lockset drilling guide of claim 64, wherein said positioning member laterally displaces said opening along a plane defined by said second

flange when said positioning member is moved from said first position to said second position.

70. (New) A lockset drilling guide system comprising:

- a door comprising a first planar face and a second planar face that is perpendicular to said first planar face;

- a frame defining an opening in said frame, said frame comprising a first flange that lies adjacent to and parallel to said first face of said door and a second flange mounted perpendicularly thereto and lying adjacent to and parallel to said second face; and

- a non-threaded positioning member removably mountable on said first flange, said positioning member moving from a first position to a second position with respect to said frame;

- wherein said positioning member laterally displaces said opening when said positioning member is moved from said first position to said second position.

71. (New) The lockset drilling guide system of claim 70, wherein said non-threaded positioning member is movable independent of movement by said second flange.

72. (New) The lockset drilling guide system of claim 70, wherein said opening is formed on said second flange.

73. (New) The lockset drilling guide system of claim 70, wherein at said first position said positioning member is attached to said first flange.

74. (New) The lockset drilling guide system of claim 73, wherein at said second position said positioning member is unattached to said first flange.

75. (New) The lockset drilling guide system of claim 70, wherein said positioning member laterally displaces said opening along a plane defined by

said second flange when said positioning member is moved from said first position to said second position.

76. (New) The drilling guide system of claim 70, wherein said first flange does not contact said first face of said door and said second flange contacts said second face of said door when said positioning member at said first position.

77. (New) The drilling guide system of claim 77, wherein said first flange contacts said first face of said door and said second flange contacts said second face of said door when said positioning member at said second position.

78. (New) A lockset drilling guide comprising:

a frame defining an opening in said frame, said opening contained within a plane and said frame comprising a first flange and a second flange mounted perpendicularly thereto; and

a non-threaded positioning member removably mountable on said first flange, said positioning member moving from a first position to a second position with respect to said frame;

wherein said positioning member laterally displaces said opening within said plane when said positioning member is moved from said first position to said second position.

79. (New) The lockset drilling guide of claim 78 wherein said non-threaded positioning member is movable independent of movement by said second flange.

80. (New) The lockset drilling guide of claim 78, wherein said opening is formed on said second flange.

81. (New) The lockset drilling guide of claim 78, wherein at said first position said positioning member is attached to said first flange.

82. (New) The lockset drilling guide of claim 81, wherein at said second position said positioning member is unattached to said first flange.

83. (New) A lockset drilling guide system comprising:

a door comprising a first planar face and a second planar face that is perpendicular to said first planar face;

a frame defining an opening in said frame, said frame comprising a first flange that lies adjacent to and parallel to said first face of said door and a second flange mounted perpendicularly thereto and lying adjacent to and parallel to said second face; and

a non-threaded positioning member removably mountable on said first flange, said positioning member moving from a first position to a second position with respect to said frame;

wherein said positioning member laterally displaces said opening within said plane when said positioning member is moved from said first position to said second position.

84. (New) The lockset guide system of claim 83 wherein said non-threaded positioning member is movable independent of movement by said second flange.

85. (New) The lockset drilling guide system of claim 83, wherein said opening is formed on said second flange.

86. (New) The lockset drilling guide system of claim 83, wherein at said first position said positioning member is attached to said first flange.

87. (New) The lockset drilling guide system of claim 86, wherein at said second position said positioning member is unattached to said first flange.

88. (New) The drilling guide system of claim 83, wherein said first flange does not contact said first face of said door and said second flange contacts said second face of said door when said positioning member at said first position.

89. (New) The drilling guide system of claim 88, wherein said first flange contacts said first face of said door and said second flange contacts said second face of said door when said positioning member at said second position.

90. (New) A method of forming a hole in a first door for the placement of a lockset, said method comprising:

- providing a door;

- providing a lockset drilling guide comprising:

- a frame defining an opening in said frame;

- a non-threaded positioning member that is removably mounted on said frame;

- determining a desired position on said door for forming a hole at said desired position;

- based on said determined desired position, moving said positioning member from a first position to a second position from a first hypothetical place when said lockset drilling guide is mounted to said door at a mounting position and wherein said positioning member is at said first position and not aligned with said desired position to an actual place when said lockset drilling guide is actually mounted to said door at said mounting position and said opening is aligned with said desired position;

- mounting said lockset drilling guide to said door so that said opening is aligned with said desired position; and

- inserting a drilling tool within said opening and forming said hole by said drilling tool.
